② What is security and privacy research?

🔍 Quantification of Kin Genomic Privacy for the Masses

M. Humbert, D. Dupertuis, M. Cherubini, and K. Huguenin. Quantification of Kin Genomic Privacy for the Masses. Major revision for USENIX Security Symp. 2021.

Genomics

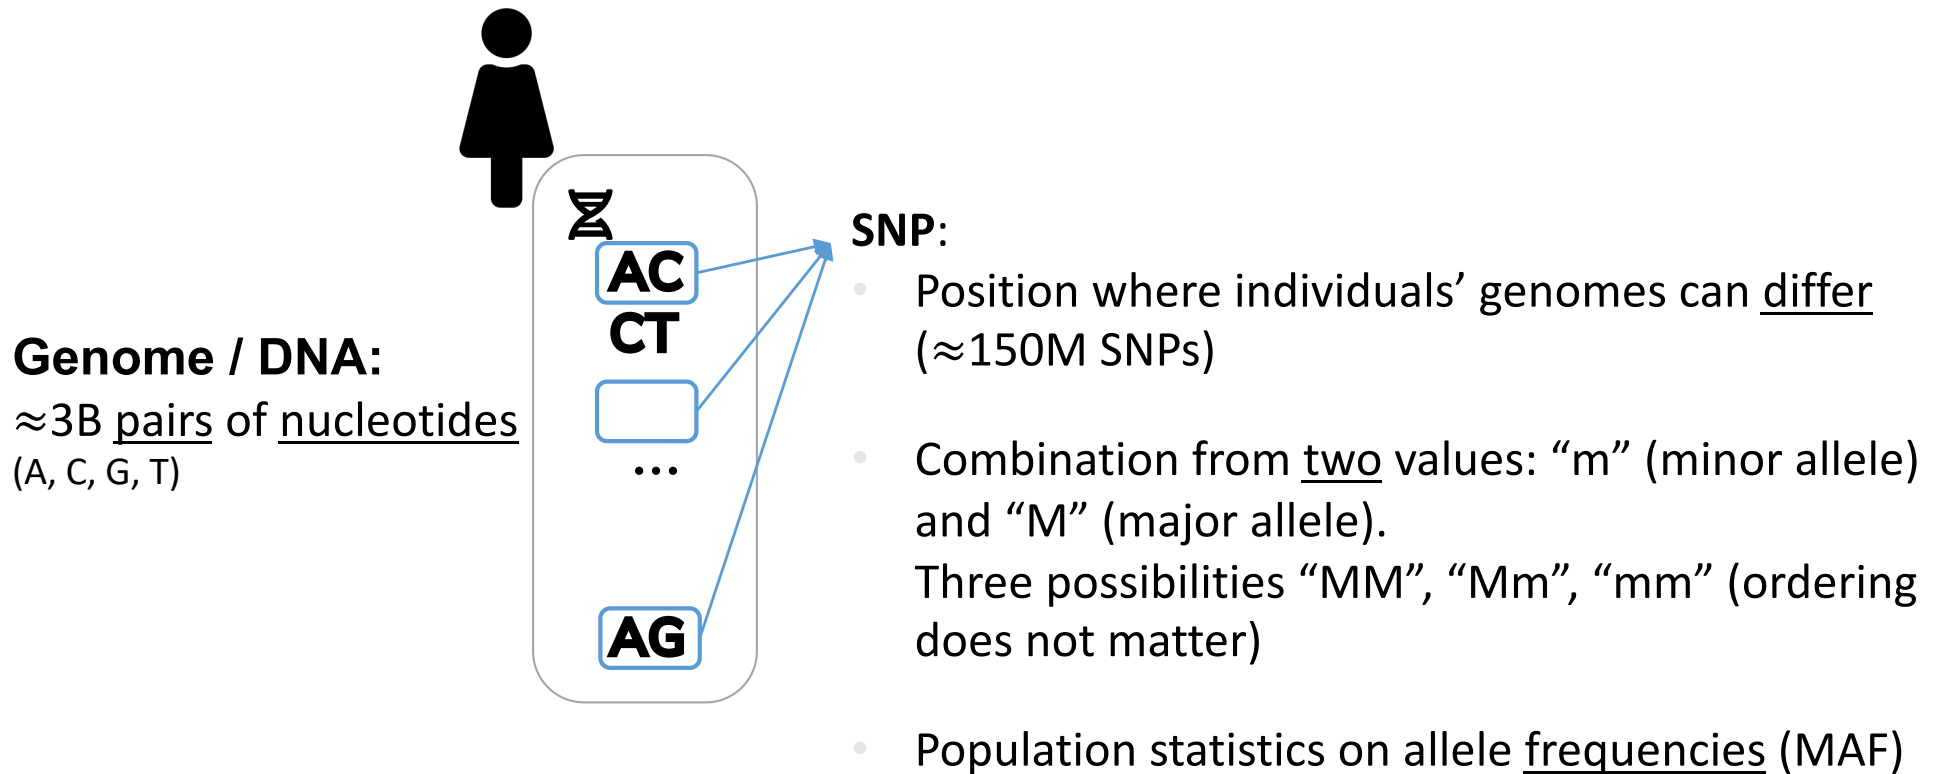

Genome / DNA:

≈3B pairs of nucleotides
(A, C, G, T)

🧬 Genomics

🧬 Genomics

Genome / DNA:

≈3B pairs of nucleotides
(A, C, G, T)

SNP:

- Position where individuals' genomes can differ (≈150M SNPs)
- Combination from two values: “m” (minor allele) and “M” (major allele).
Three possibilities “MM”, “Mm”, “mm” (ordering does not matter)
- Population statistics on allele frequencies (MAF)

Genomic privacy

Your genome influences your physical appearance, but also your non-visible attributes, such as your predisposition to certain diseases or behaviors. It is immutable.

Genomic privacy

Your genome influences your physical appearance, but also your non-visible attributes, such as your predisposition to certain diseases or behaviors. It is immutable.

This information can also be used to discriminate against you, for example, to deny you a health insurance, a job or a loan. It also creates (national) security threats.

Des tests ADN pour connaître les risques de développer une maladie

Faire analyser son ADN peut être risqué 19h30 / 4 min. / le 13 octobre 2019

Découvrir dans l'ADN les risques de développer une maladie, la possibilité existe et est accessible en ligne pour une centaine de francs. Des millions de personnes ont fait le test, dont de nombreux Suisses. De quoi attiser l'intérêt des assurances.

Les assureurs mènent un combat politique pour rendre obligatoire la transmission des analyses génétiques. Une première tentative a été menée sans succès l'an dernier. La commission du National avait pourtant émis une recommandation allant dans le sens de la demande des assurances, mais le Parlement n'avait pas suivi.

Parmi les arguments des opposants, la crainte que des personnes soient refusées par les assurances, ou renoncet à des analyses par peur de l'être. Mais pour les assureurs, le dossier est loin d'être refermé. "Nous referons exactement les mêmes demandes dans 3 ou 5 ans, affirme Valérie Bourdin. On verra, c'est finalement au législateur de prendre la décision".

Kin genomic privacy

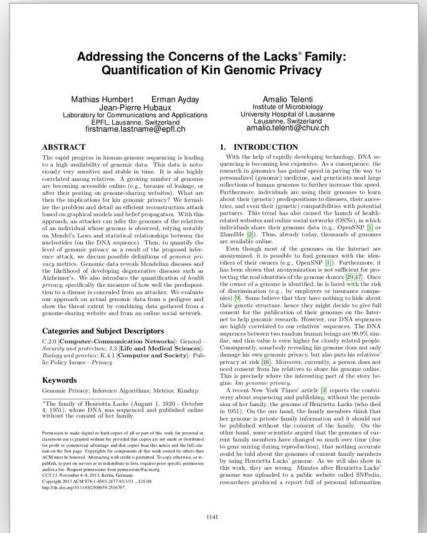

Source: Humbert et al., CCS, Nov 2013
doi 10.1145/2508859.2516707

In each pair of nucleotides in your genome, one nucleotide/allele is inherited from your mother and the other from your father.

Hence, your genome is directly linked to those of your parents and to those of your children, but also indirectly to those of all your family members.

Do Your Family Members Have a Right to Your Genetic Code?

When a woman gets her genome sequenced, questions about privacy arise for her identical twin sister.

by **Emily Mullin**

Nov 22, 2016

Kin genomic privacy

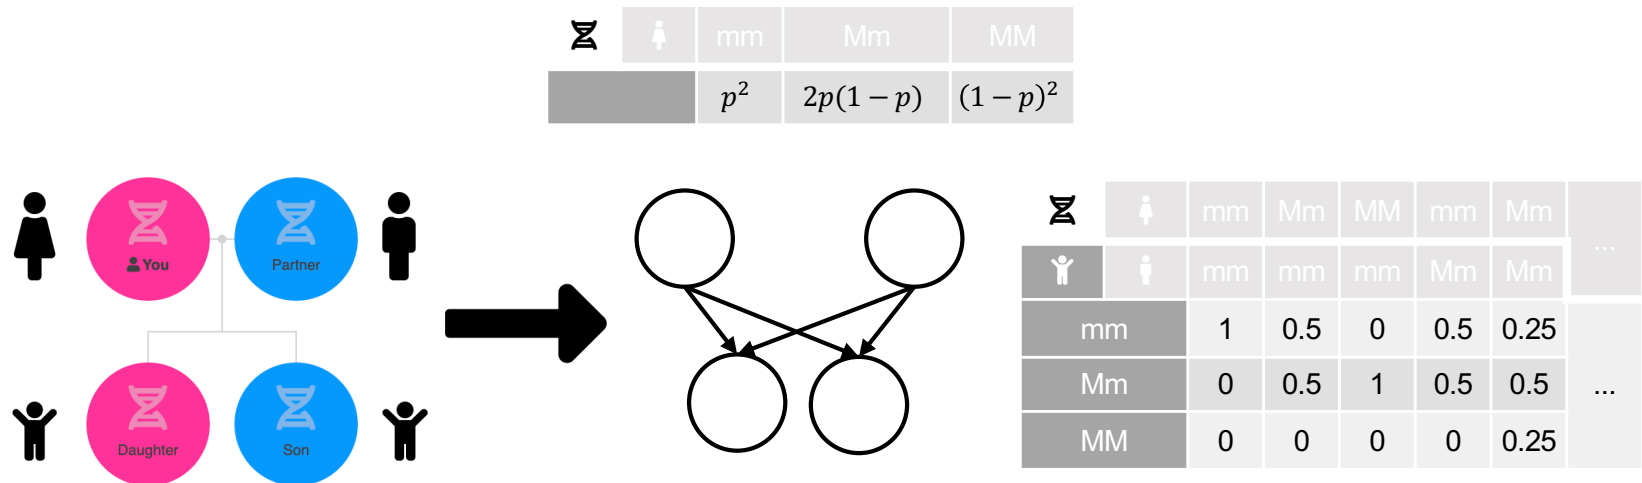

- **Concept:**

1.  Model family tree as a knowledge graph (Bayesian network)

🧬 🎭 👨👩👧👦 Kin genomic privacy

- **Concept:**

1. 🧠 Model family tree as a knowledge graph (Bayesian network)

🧬 🎭 👤 👤 👤 Kin genomic privacy

- **Concept:**

1. 🗺️ Model family tree as a knowledge graph (Bayesian network)

2. 🗄️ Input the data of the sequenced relatives

🧬 🎭 👤 👤 👤 Kin genomic privacy

- **Concept:**

1. 🧠 Model family tree as a knowledge graph (Bayesian network)

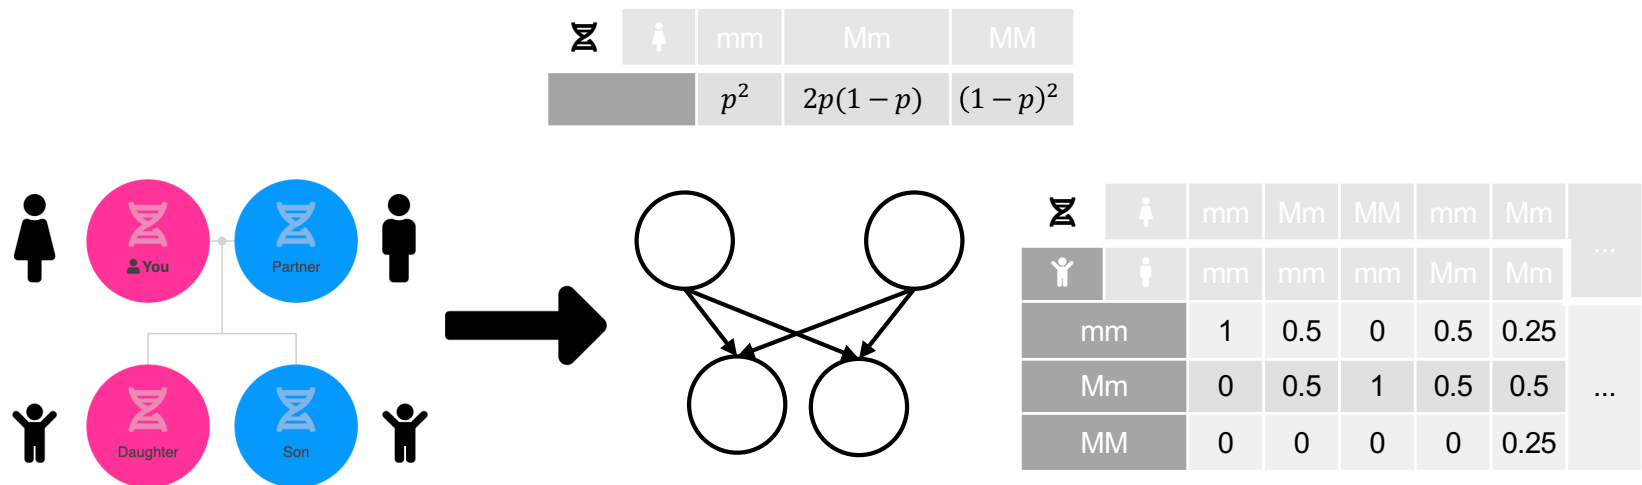

2. 🗄️ Input the data of the sequenced relatives
3. ⚙️ Perform inference using the graph

🧬 🎭 👤 👤 👤 Kin genomic privacy

• Concept:

1. 🧠 Model family tree as a knowledge graph (Bayesian network)

2. 🗄️ Input the data of the sequenced relatives
3. ⚙️ Perform inference using the graph
4. 📊 Quantify privacy according to inference error

© Objective

- ✘ Enable everyone to evaluate their kin genomic privacy in a simple and interactive way for real and hypothetical scenarios

💡 Concept

- **For each SNP (and associated MAF) :**
 1.  Consider all possible configurations of SNP values (mm, Mm, MM) for each sequenced individual
 2.  Compute the posterior distribution for the target
 3.  Quantify privacy according to the remaining uncertainty

💡 Concept

- For each SNP (and associated MAF) :

1. 🔄 Consider all possible configurations of SNP values (mm, Mm, MM) for each sequenced individual
2. ⚙️ Compute the posterior distribution for the target
3. 🗝️ Quantify privacy according to the remaining uncertainty

$$\text{privacy} = 1 - \frac{H(\text{DNA}_{\text{target}}) - H(\text{DNA}_{\text{target}} | \text{DNA}_{\text{father}} \text{DNA}_{\text{mother}} \dots)}{H(\text{DNA}_{\text{target}})}$$

uncertainty on the target's genome
when no information is available

💡 Concept

- For each SNP (and associated MAF) :

1. 🔄 Consider all possible configurations of SNP values (mm, Mm, MM) for each sequenced individual
2. ⚙️ Compute the posterior distribution for the target
3. 🗝️ Quantify privacy according to the remaining uncertainty

uncertainty on the target's genome when
the genomes of others are available

$$\text{privacy} = 1 - \frac{H(\text{DNA}_{\text{target}}) - H(\text{DNA}_{\text{target}} \mid \text{DNA}_{\text{father}} \text{DNA}_{\text{mother}} \dots)}{H(\text{DNA}_{\text{target}})}$$

uncertainty on the target's genome
when no information is available

💡 Concept

- For each SNP (and associated MAF) :

1. 🔄 Consider all possible configurations of SNP values (mm, Mm, MM) for each sequenced individual
2. ⚙️ Compute the posterior distribution for the target
3. 🗝️ Quantify privacy according to the remaining uncertainty

uncertainty on the target's genome when
the genomes of others are available

$$\text{privacy} = 1 - \frac{H(\text{target}) - H(\text{target} | \text{father} \text{ mother} \dots)}{H(\text{target})}$$

uncertainty on the target's genome
when no information is available

averaged over all configurations and all SNPs

💡 Concept

- **For each SNP (and associated MAF) :**

1. 🔄 Consider all possible configurations of SNP values (mm, Mm, MM) for each sequenced individual
2. ⚙️ Compute the posterior distribution for the target
3. 🗝️ Quantify privacy according to the remaining uncertainty

💡 **Contribution #1:** Quantify without data by considering all configurations

$$\text{privacy} = 1 - \frac{H(\text{DNA}_{\text{target}}) - H(\text{DNA}_{\text{target}} | \text{DNA}_{\text{father}} \text{DNA}_{\text{mother}} \dots)}{H(\text{DNA}_{\text{target}})}$$

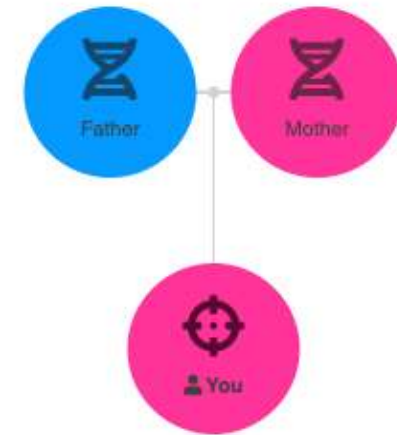

uncertainty on the target's genome
when no information is available

averaged over all configurations and all SNPs

💡 Concept: Example

- **For SNP rs753426**

- $MAF(rs753426) = 0.1$
- $H(\text{Hourglass}_{You}) = 0.7580$ [prior]

Hourglass _{Father}	Hourglass _{Mother}	P(Hourglass _{Father} , Hourglass _{Mother})	P(Hourglass _{Target} Hourglass _{Father} , Hourglass _{Mother})			H(Hourglass _{Target} Hourglass _{Father} , Hourglass _{Mother})
			MM	Mm	mm	
MM	MM	0.6561	1.0	0.0	0.0	0.0
MM	Mm	0.1458	0.5	0.5	0.0	1.0
...						

💡 Concept: Complexity & Execution time

3^N configurations, $\approx 500\text{k}$ SNPs

💡 Concept: Complexity & Execution time

💡 **Contribution #2:** Make quantification
“scalable” with optimizations

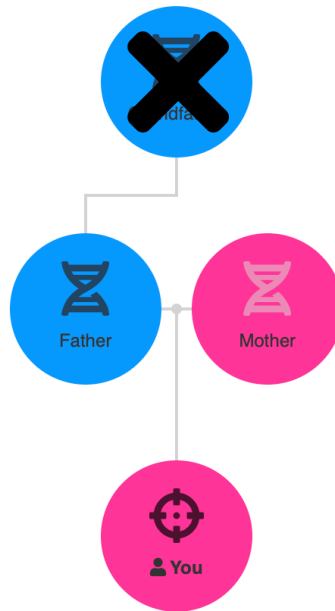

3^N configurations, $\approx 500\text{k}$ SNPs

⚙ Optimization: Simplification

- ✂ Remove individuals whose genomes do not matter when inferring the target's genome (knowing those of the others)

⚙️ Optimization: Simplification

- 🗑️ Remove individuals whose genomes do not matter when inferring the target's genome (knowing those of the others)

⚙️ Optimization: Simplification

- ✂️ Remove individuals whose genomes do not matter when inferring the target's genome (knowing those of the others)

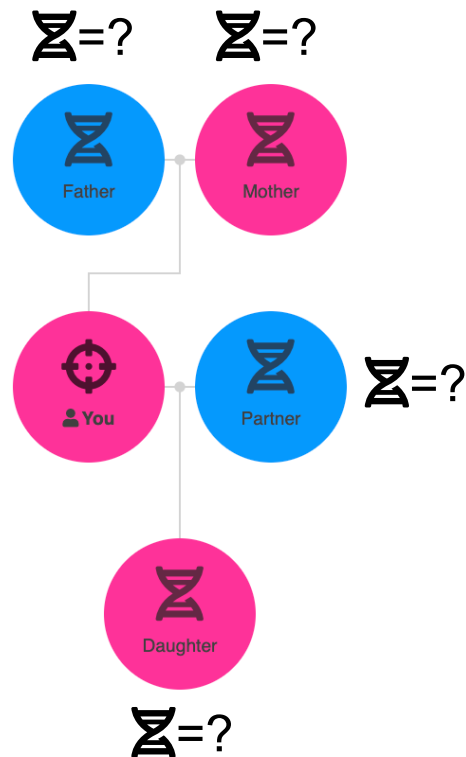

$$3^N \rightarrow 3^n \text{ configurations}$$

⚙ Optimization: Pruning

👉 Detect impossible configurations early and stop exploring

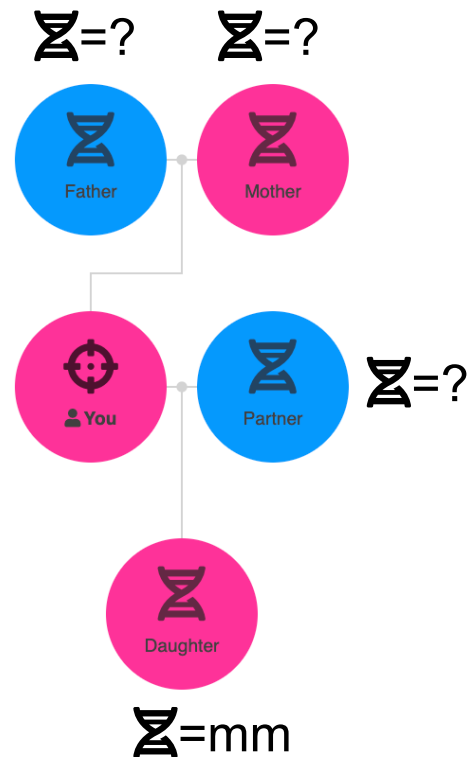

⚙️ Optimization: Pruning

👉 Detect impossible configurations early and stop exploring

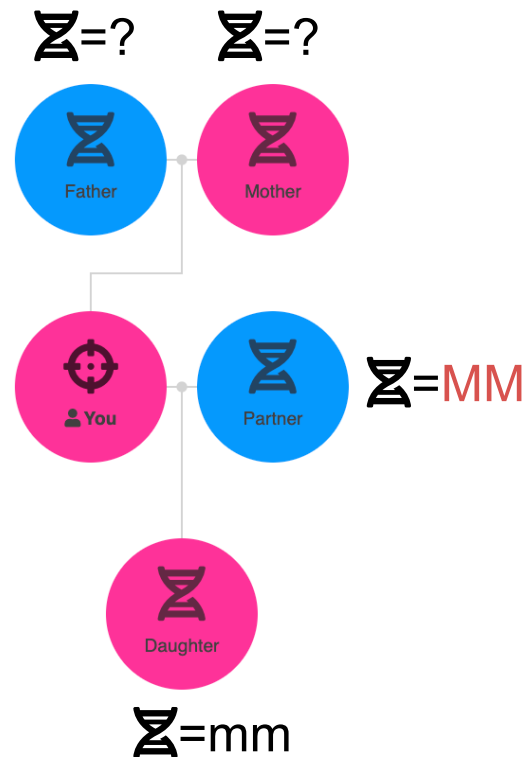

⚙️ Optimization: Pruning

👉 Detect impossible configurations early and stop exploring

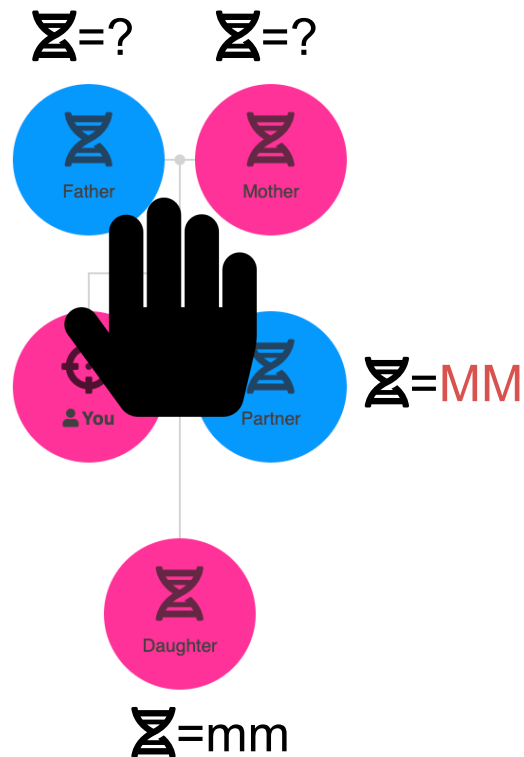

⚙️ Optimization: Pruning

👉 Detect impossible configurations early and stop exploring

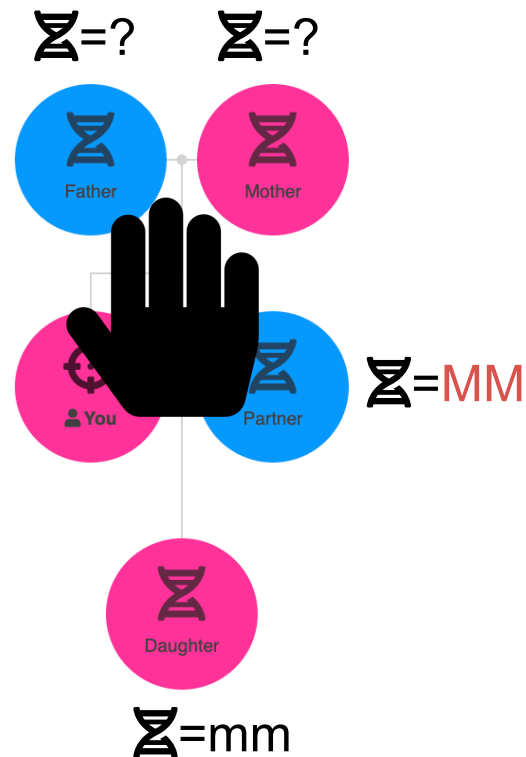

⚙️ Optimization: Pruning

👉 Detect impossible configurations early and stop exploring

⚙️ Optimization: Pruning

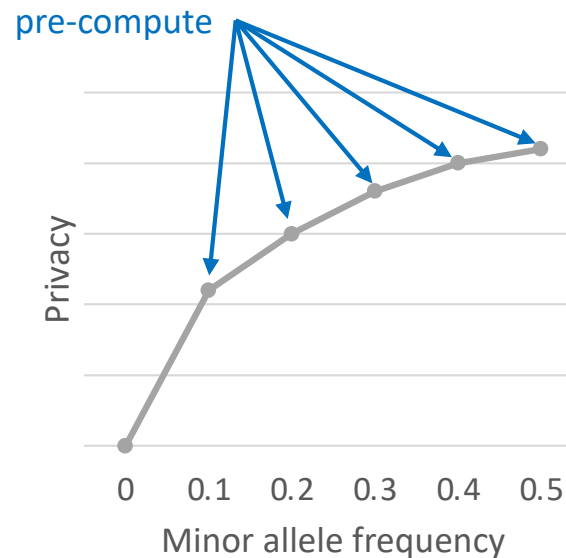

👉 Detect impossible configurations early and stop exploring

$\leq 3^n$ configurations

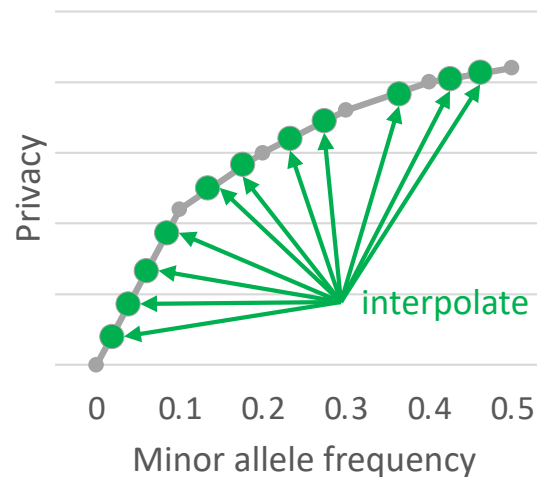

⚙️ Optimization: Interpolation

- 📊 Compute privacy for a few minor allele frequency values and interpolate for the other values (for each SNP)

⚙ Optimization: Interpolation

- 📊 Compute privacy for a few minor allele frequency values and interpolate for the other values (for each SNP)

User study

 +  |  413 users, 68 respondents |  2019

 ** A few questions...**

Before visiting this website, were you aware of the genomic privacy risk relatives can create to each other?

Yes To some extent No Rather not say

Do you find the obtained genomic privacy scores reassuring or worrying?

Highly worrying Highly reassuring

Are you more interested in your genomic privacy or rather in that of your relatives?

Mine My relatives'

Do you find this tool useful?

Not at all useful Very useful

What are the chances that you would recommend this website?

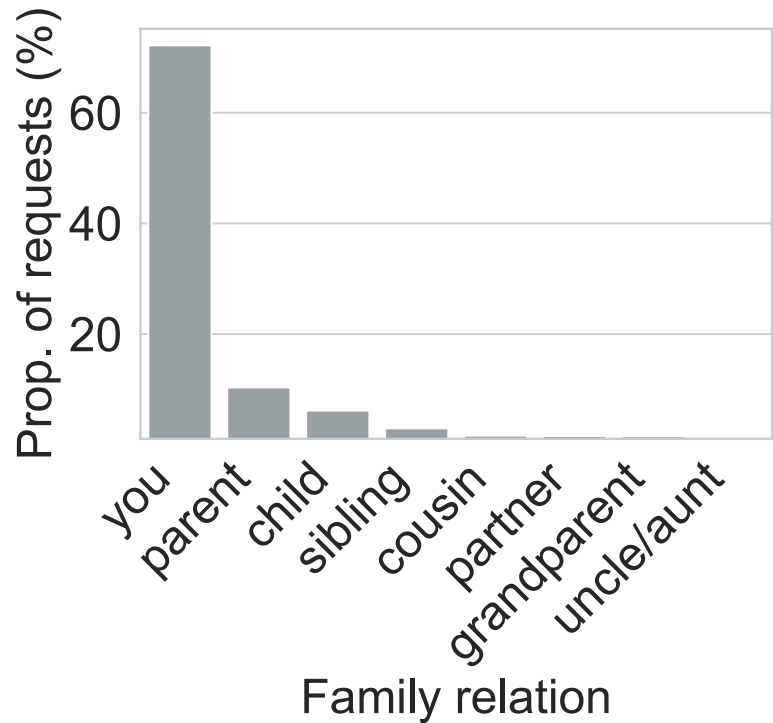

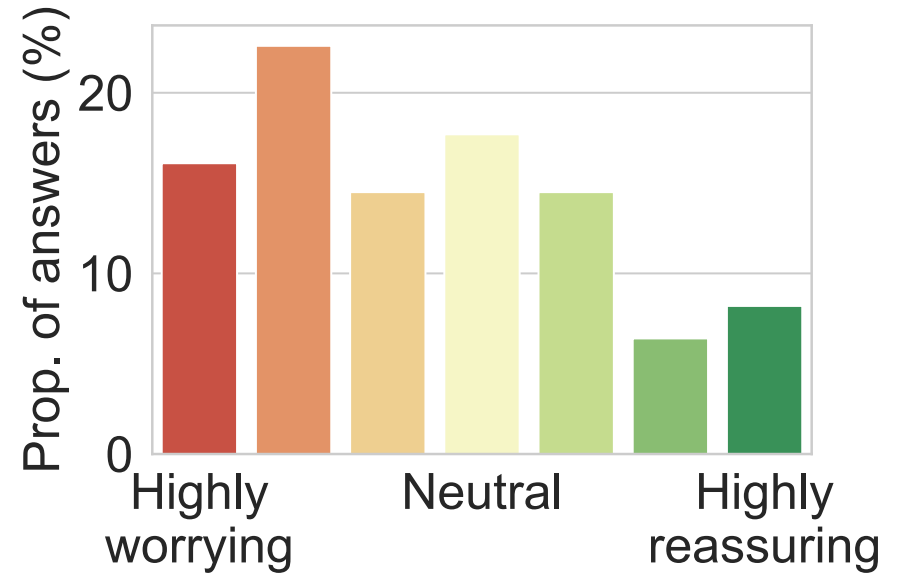

Very unlikely Very likely

Do you have any comment regarding this tool?

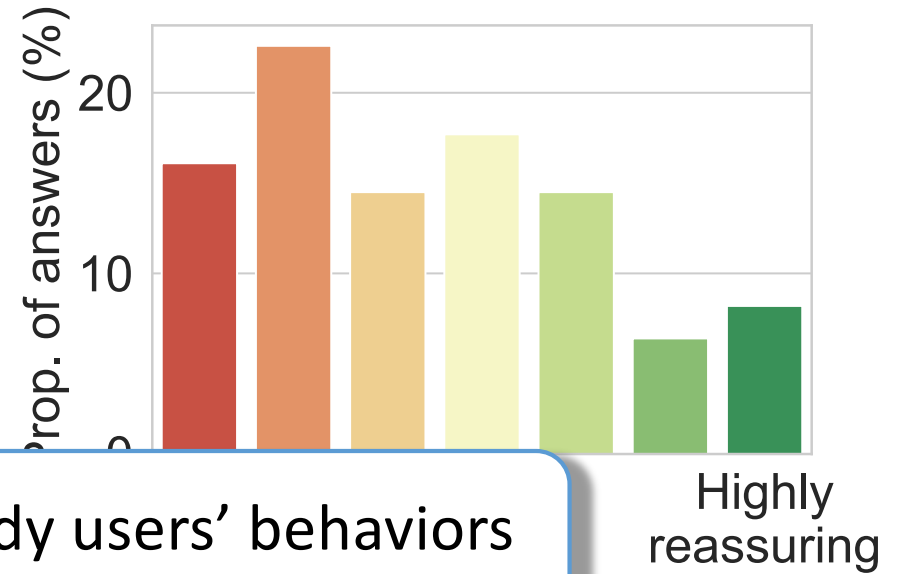

This data is collected for academic research purposes. See our [Privacy policy](#) for more information.

User study

User study

 **Contribution #3:** Study users' behaviors and perceptions

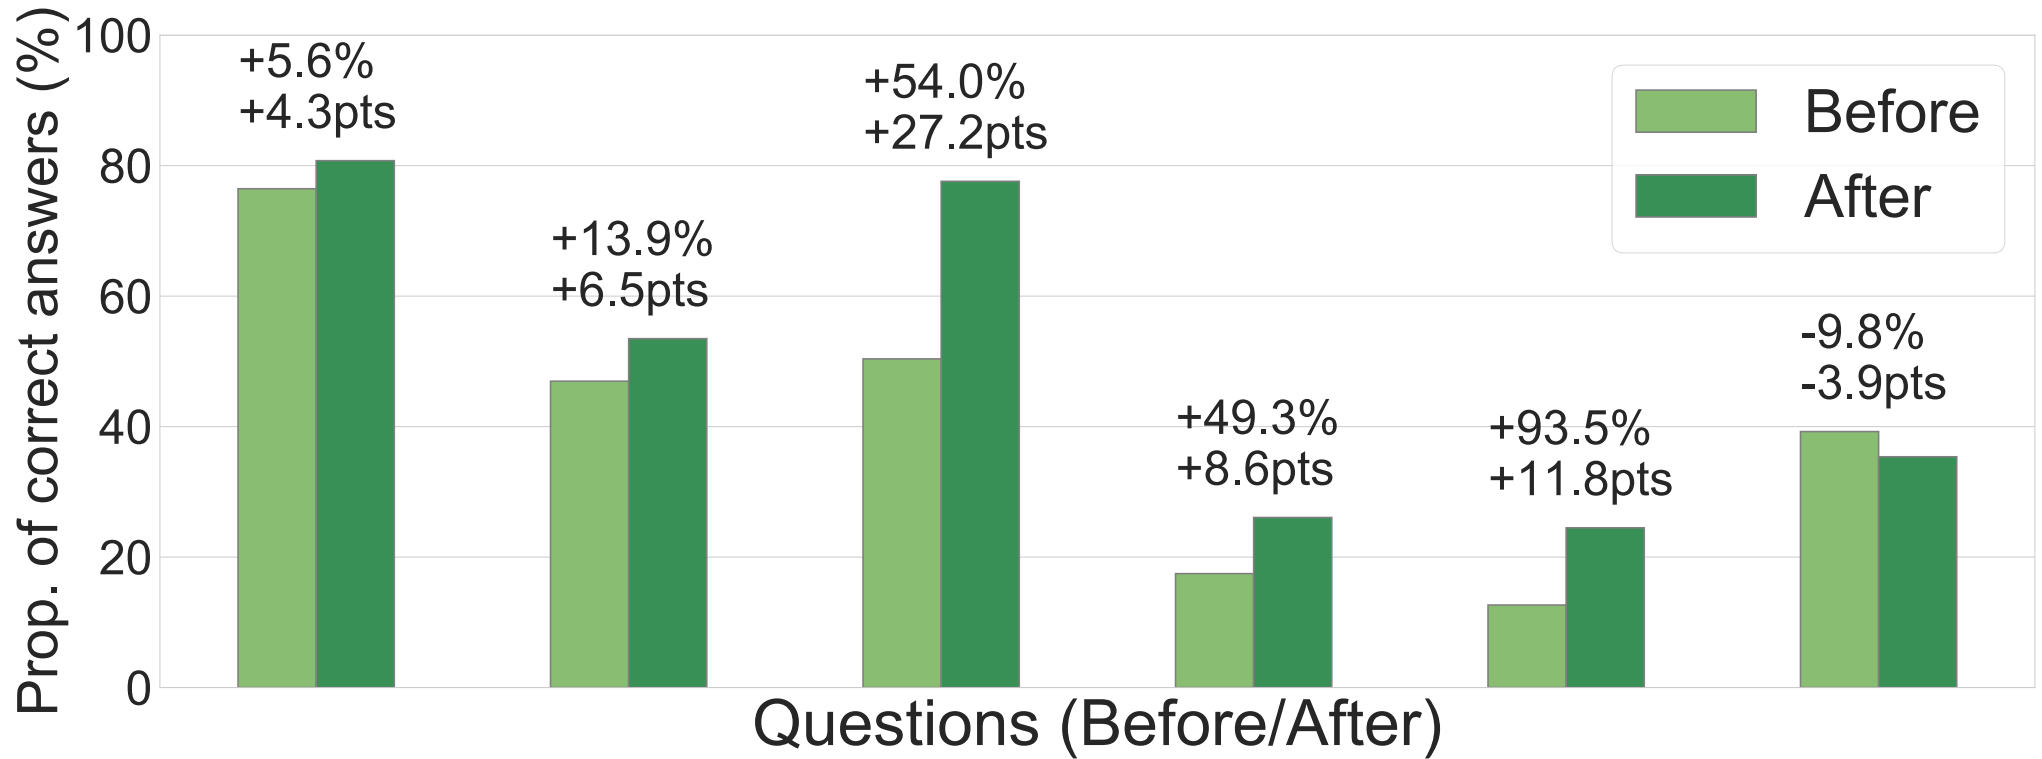

User study

 +  |  1822 users/respondents (Prolific) |  2020

- 1. In a pair of nucleotides at a given position in your genome, from whom is each nucleotide inherited?**
 - They are both inherited from your father
 - They are both inherited from your mother
 - They can be generated spontaneously – not inherited from your mother and your father
 - One is inherited from your father, and one from your mother
 - None of the above
- 2. What is a SNP?**
 - A position in the genome where nucleotides vary among the population
 - A position in the genome where nucleotides do not vary among the population
 - A disease that is very rare among the population
 - A rare anomaly in an individual's genome
 - None of the above
- 3. When the genomes of both your parents are known, compared to the case when the genome of only one of your parents is known, your privacy is...**
 - Higher The same Lower
 - It's not comparable None of the above
- 4. If the genomes of both your parents were known, what would your privacy be?**
 - 0% 70% 100% 200%
 - None of the above

Asked **before** and **after** using the tool
